

ORANGE ROUGHY WEST COAST SOUTH ISLAND (ORH 7B)

1. FISHERY SUMMARY

1.1 Commercial fisheries

From 1 October 2007 the TACC for this stock was reduced to 1 t. Previously the fishery was centred on an area near the Cook Canyon in statistical areas 033, 034 and 705. Up until 1996–97 approximately 80% of the catch was taken in winter (June–July) when fish form aggregations for spawning. From 1997–98 onwards about 50% of the catch was taken in winter. Reported domestic landings and TACCs are shown in Table 1, while the historical landings and TACC for ORH 7B are depicted in Figure 1.

Table 1: Reported landings (t) of orange roughy and TACCs (t) for ORH 7B from 1983–84 to 2007–08. QMS data from 1986–present.

| Fishing year | Reported landings | TACC |
|--------------|-------------------|-------|
| 1983–84* | 2 | – |
| 1984–85* | 282 | – |
| 1985–86* | 1 763 | 1 558 |
| 1986–87* | 1 446 | 1 558 |
| 1987–88 | 1 413 | 1 558 |
| 1988–89 | 1 750 | 1 708 |
| 1989–90 | 1 711 | 1 708 |
| 1990–91 | 1 683 | 1 708 |
| 1991–92 | 1 604 | 1 708 |
| 1992–93 | 1 139 | 1 708 |
| 1993–94 | 701 | 1 708 |
| 1994–95 | 290 | 1 708 |
| 1995–96 | 446 | 430 |
| 1996–97 | 425 | 430 |
| 1997–98 | 330 | 430 |
| 1998–99 | 405 | 430 |
| 1999–00 | 284 | 430 |
| 2000–01 | 161 | 430 |
| 2001–02 | 95 | 110 |
| 2002–03 | 90 | 110 |
| 2003–04 | 119 | 110 |
| 2004–05 | 106 | 110 |
| 2005–06 | 77 | 110 |
| 2006–07 | 125 | 110 |
| 2007–08 | 6 | 1 |

*FSU data.

Catches in the early-mid 1990s (especially 1994–95) were well below the TACC. The TACC was reduced to 430 t for the 1995–96 fishing year, and then was reduced further to 110 t from 1 October 2001.

ORANGE ROUGHY (ORH 7B)

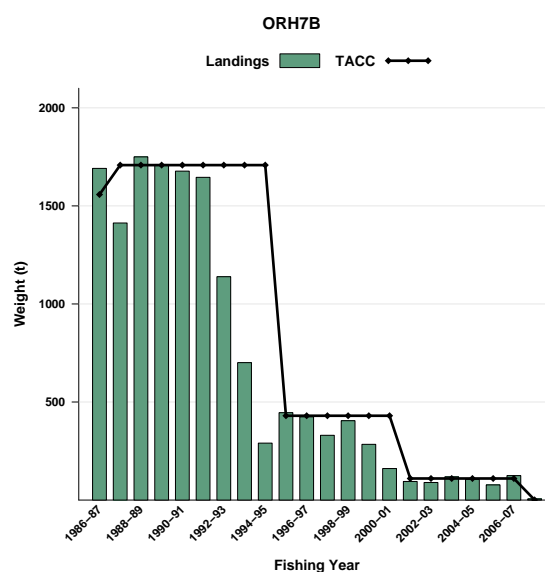

Figure 1: Historical landings and TACC for ORH 7B (Auckland East). Note that this figure does not show data prior to entry into the QMS.

1.2 Recreational fisheries

There is no known recreational fishery for orange roughy in this area.

1.3 Customary non-commercial fisheries

There is no known customary non-commercial fishing for orange roughy in this area.

1.4 Illegal catch

There is no quantitative information available on illegal catch.

1.5 Other sources of mortality

There is no quantitative information available on other sources of mortality in this fishery.

2. STOCKS AND AREAS

There are no new data which would alter the stock boundaries given in previous assessment documents.

Orange roughy in this fishery are thought to be a single stock. Genetic studies have shown that samples of Cook Canyon orange roughy are significantly different from Challenger Plateau and Puysegur Bank samples. Moreover, the size structure and parasite composition differ from fish on the Challenger Plateau. Spawning occurs at a similar time to fish on the Challenger Plateau and the Puysegur Bank.

3. STOCK ASSESSMENT

The previous assessment for this stock was carried out in 2004 and is summarised in the 2006 Plenary Report. Biomass was estimated to be 17% B_0 (95% confidence interval 14-23%) when CPUE was assumed directly proportional to abundance.

An updated assessment was attempted in 2007 with the addition of catch data up to 2005–06 and new standardised CPUE indices. The Working Group rejected the assessment on the basis of the poor fit to the CPUE data. The effect was similar to the result from the 2004 assessment; namely a slow rebuild in recent years, which was not supported by the CPUE data.

3.1 Estimates of fishery parameters and abundance

Commercial catch and effort data are available from 1985 and were examined using both an unstandardised and a standardised analysis. Unstandardised catch rates have declined substantially over the course of the fishery but have shown no clear trend in recent years (Table 2).

Most recent effort in the fishery has been by small, inshore vessels. Since 2001–02, when the TAC was dropped to 110 t, effort (in vessel days) has decreased except for in 2004–05 when there was an increase. The average distance towed in the last four years is more than twice its initial level.

Table 2: Summary of groomed data from TCEPR and CELR forms.

| Fishing year | Number of vessel days | Number of tows | Total estimated catch (t) | Mean daily catch rate (t/tow) | Mean daily catch rate (t/h) |
|--------------|-----------------------|----------------|---------------------------|-------------------------------|-----------------------------|
| 1985–86 | 138 | 357 | 1 544 | 4.5 | 2.9 |
| 1986–87 | 132 | 405 | 1 250 | 4.0 | 2.7 |
| 1987–88 | 132 | 420 | 1 250 | 3.4 | 2.3 |
| 1988–89 | 133 | 368 | 827 | 2.5 | 1.6 |
| 1989–90 | 123 | 356 | 1 282 | 4.5 | 5.6 |
| 1990–91 | 208 | 632 | 1 657 | 2.8 | 3.3 |
| 1991–92 | 238 | 810 | 1 601 | 2.0 | 1.4 |
| 1992–93 | 258 | 784 | 1 128 | 1.5 | 2.3 |
| 1993–94 | 298 | 708 | 660 | 1.1 | 0.9 |
| 1994–95 | 162 | 361 | 320 | 0.9 | 1.6 |
| 1995–96 | 66 | 150 | 275 | 2.2 | 1.7 |
| 1996–97 | 90 | 182 | 244 | 1.3 | 7.5 |
| 1997–98 | 96 | 228 | 170 | 0.7 | 0.3 |
| 1998–99 | 188 | 566 | 359 | 0.6 | 0.2 |
| 1999–00 | 213 | 647 | 259 | 0.4 | 0.1 |
| 2000–01 | 149 | 442 | 162 | 0.4 | 0.1 |
| 2001–02 | 117 | 282 | 76 | 0.3 | 0.1 |
| 2002–03 | 97 | 292 | 112 | 0.4 | 0.2 |
| 2003–04 | 90 | 252 | 118 | 0.4 | 0.2 |
| 2004–05 | 121 | 393 | 102 | 0.3 | 0.1 |
| 2005–06 | 87 | 257 | 73 | 0.3 | 0.2 |

Up until 1996–97 approximately 70% of the estimated catch was recorded on TCEPR forms. In 1997–98 this decreased to 20% and now nearly all the catch is recorded on CELR form. Because of this change in the fleet composition, and associated difficulties with vessel linkage across years, it was decided to split the standardised CPUE analysis into two series: (i) using TCEPR data from 1985–86 through to 1996–97, and (ii) using CELR data from 1990–91 through to 2005–06. In addition, in order to increase vessel linkage across years, it was decided to use all months of data not just that from the winter fishery (June–July) as has been done for previous standardisations.

The standardised analysis for the TCEPR data used catch per tow in a linear regression model. Indices from this model (Table 3, Figure 2) show a steep decline after the first two years, followed by a more gradual decline and a slight increase in catch rates in 1995–96 and 1996–97.

Table 3: Standardised CPUE indices (relative year effect) based on TCEPR data with number of vessel tows from 1985–86 to 1996–97.

| Year | CPUE index | CV. | Number of tows | Year | CPUE index | CV | Number of tows |
|---------|------------|------|----------------|---------|------------|------|----------------|
| 1985–86 | 1.99 | 0.20 | 153 | 1991–92 | 0.48 | 0.23 | 231 |
| 1986–87 | 2.13 | 0.23 | 150 | 1992–93 | 0.29 | 0.23 | 230 |
| 1987–88 | 1.11 | 0.26 | 212 | 1993–94 | 0.14 | 0.25 | 341 |
| 1988–89 | 0.58 | 0.22 | 310 | 1994–95 | 0.13 | 0.27 | 172 |
| 1989–90 | 0.61 | 0.22 | 236 | 1995–96 | 0.51 | 0.33 | 37 |
| 1990–91 | 0.76 | 0.23 | 238 | 1996–97 | 0.41 | 0.26 | 104 |

The standardised analysis for the CELR data used daily catch in a linear regression model. Indices from this model (Table 4, Figure 2) show a steep decline for the first four years, followed by an increase to a peak in 1995–96, and subsequent low catch rates after then.

ORANGE ROUGHY (ORH 7B)

Table 4: Standardised CPUE indices (relative year effect) based on CELR data with number of days from 1990–91 to 2005–06.

| Year | CPUE index | CV | Number of days | Year | CPUE index | CV | Number of days |
|-----------|------------|------|----------------|-----------|------------|------|----------------|
| 1990–1991 | 2.17 | 0.27 | 110 | 1999–2000 | 0.34 | 0.27 | 131 |
| 1991–1992 | 1.11 | 0.27 | 108 | 2000–2001 | 0.34 | 0.28 | 88 |
| 1992–1993 | 0.74 | 0.27 | 126 | 2001–2002 | 0.33 | 0.28 | 73 |
| 1993–1994 | 0.28 | 0.28 | 81 | 2002–2003 | 0.61 | 0.26 | 67 |
| 1994–1995 | 0.53 | 0.30 | 46 | 2003–2004 | 0.59 | 0.25 | 75 |
| 1995–1996 | 1.16 | 0.33 | 29 | 2004–2005 | 0.35 | 0.24 | 114 |
| 1996–1997 | 0.53 | 0.38 | 19 | 2005–2006 | 0.36 | 0.26 | 80 |
| 1997–1998 | 0.36 | 0.30 | 52 | | | | |
| 1998–1999 | 0.39 | 0.28 | 112 | | | | |

Figure 2: The CPUE indices based on: (i) TCEPR data (solid line and crosses) covering 1985–86 to 1996–97, and (ii) CELR data (triangles and dashed line) covering 1990–91 to 2005–06. The CELR index has been scaled so that it has the same mean value as the TCEPR index in the years that they overlap.

3.2 Biomass estimates

No estimates of current biomass are available. Based on previous stock assessments using CPUE data the TACC was cut back severely from about 1700 t in 1994–95 to 110 t in 2000–01. By the late 1990s the stock was believed to be well below B_{MSY} (17% B_0 in the 2004 assessment). Despite the large reduction in annual removals from the stock since 2001–02 recent catch rates have not increased over the last 5 years.

An updated assessment was attempted in 2007 with the addition of catch data up to 2005–06 and new standardised CPUE indices (Figure 2) based on TCEPR data (1986 to 1997) and a separate CELR series (1991 to 2006). These data were incorporated in a Bayesian stock assessment with deterministic recruitment to estimate stock size. The Working Group rejected the assessment on the basis of the poor fit to the recent CPUE data. The model was insensitive to the recent CPUE data and predicted a rebuild (driven by the recruitment assumptions) that is not supported by any observations in the fishery.

4. STATUS OF THE STOCK

No estimates of current biomass are available. The current stock size is most likely below B_{MSY} as catch rates have not increased over the last 5 years despite a large reduction in annual removals from the stock. The assessment model projected a rebuild since 2000, which was not supported by the data from the fishery. The Working Group rejected the assessment results because of the poor fit to recent

CPUE data. The TACC was reduced to 1 t (effectively closing the fishery) from 1 October 2007 to promote the rebuilding of the stock towards B_{MSY} .
