RIBALDO (RIB)

1. FISHERY SUMMARY

1.1 Commercial fisheries

In New Zealand ribaldo is caught mainly on bottom longlines and as a bycatch of trawling. Up to 4500 t were reported in 1977 by Japanese and Korean longline vessels target fishing for ling on the Chatham Rise and east coast of the South Island in the 1970s. Since 1982-83, overall reported catch has been mainly from the Chatham Rise and east coast South Island (QMAs 3 & 4) but has declined somewhat from these areas since being introduced into the QMS in the 1998-99 fishing year. Since entering the QMS, a similar decline in reported ribaldo catch is seen in other QMAs with the exception of RIB 7 where reported catches have been increasing. RIB 7 now has the highest reported catch of any QMA. The reasons for these changes in catch levels are not well understood as ribaldo is mainly taken as bycatch. Levels of discarding and unreported catch are likely to have changed with the introduction of ribaldo into the QMS. Ribaldo are caught throughout the New Zealand Exclusive Economic Zone by a variety of fishing methods in different target fisheries but mainly as bycatch in bottom trawls targeting hoki (*Macruronus novaezelandiae*), hake (*Merluccius australis*) and ling (*Genypterus blacodes*) and bottom longlines for ling.

There is no seasonality of catch other than on the west coast South Island which is related to target fishing of hoki and hake during the winter spawning season. Catches by Japanese and Korean longliners in the mid 1970s are shown in Table 1. Landings from 1982-83 onwards are shown in Table 2, while Figure 1 shows the historical landings and TACC values for the main RIB stocks.

Table 1: Japanese and Korean longline catch (t) of ribaldo ("deep-sea cod¹") from New Zealand waters, probably mostly Chatham Rise and east coast South island, by calendar year from 1975-77.

Year	1975	1976	1977
Japan	2 417	4 920	4 283
Korea	-	-	2 86

^{1.} Reported as "cods" but considered to be mainly ribaldo. The Korean fleet began fishing in April 1977.

Ribaldo was introduced into the QMS from 1 October 1998, no customary, recreational or other mortality allowances have been given. Historical catch limits up to the most recent fishing year (2011-12) are shown in Table 2. TACCs were increased from 1 October 2006 in RIB 6 to 231 t and in RIB 7 to 330 t. In these stocks landings were above the TACC for a number of years and the TACCs have 929

been increased to the average of the previous 7 years plus an additional 10%. Current levels of reported catch are well below TACCs apart from in RIB 7 where they have continued to exceed the TACC, with the exception of the most recent fishing year.

Table 2: Reported landings (t) of ribaldo by QMA for fishing years 1983-84 to 2011-12 and TACCs (t). QMA 10 has no catches and a TACC of 0. Total includes catches from outside the NZ EEZ.

Figure 1: Historical landings and TACC for the seven main RIB stocks. From top to bottom: RIB1 (Auckland East), RIB2 (Central East) and RIB3 (South East Coast). [Continued on next page].

Figure 1 [Continued]: Historical landings and TACC for the seven main RIB stocks. From top to bottom: RIB4 (South East Chatham Rise), RIB5 (Southland) and RIB6 (Sub-Antarctic). [Continued on next page].

Figure 1 [Continued]: Historical landings and TACC. Above: RIB7 (Challenger).

In RIB 1, ribaldo are taken as bycatch primarily in the ling and to lesser extent bluenose bottom longline fisheries. There is also some direct targeting of ribaldo by bottom longline. In RIB 2, ribaldo are taken as bycatch primarily in the ling and bluenose bottom longline fisheries and to a lesser extent the hoki and orange roughy bottom trawl fisheries. There is also some direct targeting of ribaldo by bottom longline. In RIB 8 very small catches (< 1 t) of ribaldo are reported mainly in bottom trawl and bottom longline fisheries for a variety of target species. There is no reported targeting of ribaldo in RIB 8 and since entering the QMS in the 1998-99 fishing year the TACC of one tonne has never been caught. In RIB 9 very small amounts of ribaldo are taken as bycatch in orange roughy, cardinal and alfonsino target trawl fisheries and in the ling bottom longline fishery. In all areas, a variety of other fishing methods and target fisheries also report catching ribaldo but only in negligible amounts. The majority of the ribaldo catch is taken in RIB 3-7. Fisheries interactions for these areas are described in the Status of the Stocks tables in Section 5.

1.2 Recreational fisheries

There are no known recreational fisheries for ribaldo.

1.3 Customary non-commercial fisheries

There is no known customary non-commercial fishing for ribaldo.

1.4 Illegal catch

Estimates of illegal catch are not available.

1.5 Other sources of mortality

There is no quantitative information on the level of other sources of mortality.

2. BIOLOGY

933

Ribaldo is known from the North Atlantic Ocean from Iceland to West Africa, the western Mediterranean Sea, the Indian Ocean south of Madagascar and the Pacific Ocean from Australia, New Zealand and Chile. In New Zealand it is widespread and has been caught by research trawl at depths of about 200-1300 m. It appears to be most common at 500-1000 m. The relatively high catch by bottom longline suggests that it favours rough bottom habitats.

Ribaldo reaches fork lengths (FL) of about 75 cm and 65 cm for females and males respectively. Most research trawls have caught fish ranging from 30 to 70 cm FL. The 50% length at sexual maturity has been estimated at 45 cm total length for New Zealand ribaldo (O'Driscoll *et al.* 2003). Analyses of

data on female gonad development, collected by the Ministry of Fisheries Observer Programme, indicates a winter/early spring spawning season. Fish do not appear to form large spawning aggregations. Locations at which spawning fish have been observed are the upper North Island (extending outside the EEZ), north-east and west Chatham Rise, the area between the Snares and Auckland Islands shelves, and west coast of the South Island. Early life history is largely unknown but a few individuals less than 10 cm FL were captured in plankton nets in the upper 200 m of the water column over bottom depths of about 1000 m at the south west end of Chatham Rise. The distribution of juveniles < 28 cm is similar to that of observed spawning females. Juveniles up to 35 cm have been observed in all fished areas of the EEZ except for the Bounty Islands.

Ageing by zone counts of otoliths has been validated using radiometric techniques (Sutton *et al.* 2010) using ribaldo caught on Chatham Rise trawl surveys by *Tangaroa* from 2001 to 2005. Maximum observed ages were 37 and 39 years for females and males respectively. Von Bertalanffy growth parameters are presented in Table 3, estimates of natural mortality (*M*) are presented in Table 4 and length-weight parameters in Table 5.

Ribaldo are caught in low numbers both in research trawl surveys and in observed commercial fisheries making tracking of cohorts by length frequencies difficult. Collection of otoliths is required to construct catch-at-age series for any fishing areas. Analyses of trawl survey and observer data has shown that biomass of females is usually greater than that of males on the Chatham Rise although sex ratios are about 1:1. In the SubAntarctic the biomass and numbers of females are significantly greater than males, often over 10:1. Sex ratios elsewhere in the EEZ are less clear.

3. STOCKS AND AREAS

It is not known whether different regional stocks of ribaldo occur in New Zealand waters but it is possible that there are separate stocks based on natural bathymetric boundaries. The Working Group had previously agreed on five fishstocks based on the four main fishing areas plus the Kermadec area, i.e., the east coast of the North Island (QMAs 1 and 2), Chatham Rise and east coast South Island (QMAs 3 and 4), Southland and Sub-Antarctic (QMAs 5 and 6), the west coast of New Zealand (QMAs 7, 8 and 9) and QMA 10. A review of all available information in 2010 indicated that the main fishing areas are still as found previously. The review also indicated spawning activity in all areas, except RIB 8 and RIB 10 (for which there is no information). This is not inconsistent with the

management of the fishery by the current 10 FMAs. Highly skewed sex ratios in the SubAntarctic have unknown implications for stock structure.

4. STOCK ASSESSMENT

The Middle Depths Working Group agreed in February 2011 that relative biomass estimates of ribaldo from middle depth trawl surveys on the Chatham Rise and the SubAntarctic were suitable for monitoring major changes in ribaldo abundance for RIB 3 & 4 and RIB 5 & 6 respectively. Standardised CPUE indices from the spawning hoki and hake target fisheries in RIB 7 were not accepted although this could possibly be revisited in future using daily processed catch of ribaldo instead of estimated catch at the tow by tow level. There are no stock monitoring indices available for RIB 1, 2, 8 & 9

4.1 Estimates of fishery parameters and abundance

No estimates of fishery parameters have been made. Analyses of research trawl survey abundance estimates on the Chatham Rise and Sub-Antarctic suggest they may be suitable for monitoring major changes in abundance. While the Sub-Antarctic survey does not fully cover the depth range of ribaldo the Chatham Rise survey has been extended down to 1300 m since 2010. Biomass from the deep strata (800-1300 m) accounted for 23% of the total ribaldo biomass in 2010.

Dunn (2006) described the fishery up to 2002-03 but found that interpreting CPUE data was difficult because ribaldo are taken mainly as by-catch of other fisheries and the CPUE may reflect changes in those fisheries rather than ribaldo abundance. MacGibbon & Hurst (2011) carried out a standardised trawl CPUE analysis of hoki and hake in RIB 7 from 1999-2009. The index was problematic for the same reasons listed above. The trend showed a slight decline from 1999 to 2002 and was fairly steady thereafter.

4.2 Biomass estimates

Estimates of biomass are given in Table 6.

4.3 Yield estimates and projections

MCY cannot be estimated.

CAY cannot be estimated.

4.5 Other yield estimates and stock assessment results

No information is available.

Table 6: Biomass indices (t) and coefficients of variation (CV) of ribaldo from Tanagroa trawl surveys (Assumptions: areal availability, vertical availability and vulnerability = 1). NB: estimates are for the core strata only for the respective time series.

Figure 2: Doorspread biomass estimates of ribaldo by sex from the Chatham Rise 1991 to 2011 (upper) and Sub-Antarctic 1991 to 1993 and 2000 to 2009 (lower), from *Tangaroa* trawl surveys.

5. STATUS OF THE STOCKS

• RIB 1, 2, 7, 8 and 9

There are no accepted stock monitoring indices available for RIB 1, 2, 7, 8 & 9.

• RIB 3 & 4

Stock Status	
Year of Most Recent	2011
Assessment	
Reference Points	Target: Not established but 40% B_0 assumed
	Soft Limit: 20% B ₀

	Hard Limit: $10\% B_0$
Status in relation to Target	Unknown
Status in relation to Limits	Unlikely (< 40%) to be below soft limit
	Unlikely (< 40%) to be below hard limit

Historical Stock Status Trajectory and Current Status

Doorspread biomass estimates of ribaldo (error bars are \pm two standard deviations) from the Chatham Rise, from *Tangaroa* surveys from 1991 to 2011.

Fishery and Stock Trends	
Recent Trend in Biomass or	The relative biomass index of ribaldo from summer middle depth
Proxy	trawl surveys of the Chatham Rise is relatively flat. Precision is
	generally good in this time series (< 20%). Although numbers of
	individual ribaldo caught are low the Working Group considered
	this index to be suitable to monitor major trends in this stock.
Recent Trend in Fishing	-
Mortality or Proxy	

Projections and Prognosis	
Stock Projections or Prognosis	Stock size is Likely (> 60%) to remain near current levels under
	current catches.
Probability of Current Catch or	Soft limit: Unlikely (< 40%) for current catches
TACC causing decline below	Hard limit: Unlikely (< 40%) for current catches
Limits	

Assessment Methodology			
Assessment Type	Level 2: Partial quantitative stock assessment		
Assessment Method	Evaluation of agreed trawl survey indices thought to index RIB 3 & 4 abundance		
Main data inputs	Data collected on trawl surveys		
Period of Assessment	Latest assessment: 2011	Next assessment: 2012	
Changes to Model Structure and Assumptions	-		
Major Sources of Uncertainty	- Low numbers of individuals caught on trawl surveys; proportion of biomass deeper than 800 m (not surveyed in core strata)		
Qualifying Comments	` `	,	
-			

Fishery Interactions

In RIB 3 & 4, ribaldo are taken as bycatch primarily in the ling and hoki bottom trawl fisheries and ling bottom longline fishery.

• RIB 5 & 6

Stock Status	
Year of Most Recent	2011
Assessment	
Reference Points	Target: Not established but 40% B_0 assumed
	Soft Limit: $20\% B_0$
	Hard Limit: $10\% B_0$
Status in relation to Target	Unknown
Status in relation to Limits	Unlikely (< 40%) to be below soft limit
	Unlikely (< 40%) to be below hard limit

Historical Stock Status Trajectory and Current Status

Doorspread biomass estimates of ribaldo (error bars are \pm two standard deviations) from the Sub-Antarctic, from *Tangaroa* surveys from 1991 to 1993, and 2000 to 2009.

Fishery and Stock Trends	
Recent Trend in Biomass or	Relative biomass estimates of ribaldo from summer middle depth
Proxy	surveys of the SubAntarctic show a relatively flat index. CVs are
	consistently low in this time series (< 20%). Although numbers of
	individual ribaldo caught are low the Working Group considered
	this index to be suitable to monitor major trends in this stock.

Recent Trend in Fishing	Unknown
Mortality or Proxy	

Projections and Prognosis			
Stock Projections or Prognosis	Stock size is Likely (> 60%) to remain near current levels under current catches and TACCs.		
Probability of Current Catch or	Soft limit: Unknown		
TACC causing decline below	Hard limit: Unlikely (< 40%)		
Limits			
Assessment Methodology			
Assessment Type	Level 2: Partial quantitative stock assessment		
Assessment Method	Evaluation of agreed trawl survey indices thought to index RIB 5		
	& 6 abundance		
Main data inputs	Data collected on trawl surveys		

Period of Assessment	Latest assessment: 2011	Next assessment: 2014		
Changes to Model Structure and	-			
Assumptions				
Major Sources of Uncertainty	Low numbers of individuals caught on trawl surveys; proportion of			
	biomass deeper than 800 m (not surveyed in core strata); and			
	unknown implications of highly skewed sex ratios (females usually			
	make up > 90% of biomass) for stock structure. Observer data also			
	shows skewed sex ratios in favour of females.

Fishery Interactions

In RIB 5 & 6, ribaldo are mainly caught as bycatch in hoki and ling bottom trawl fisheries and ling bottom longline fisheries.

TACCs and reported landings for the 2011-12 fishing year are summarised in Table 7.

Table 7: Summary of TACCs (t) and reported landings (t) of ribaldo for the most recent fishing year.

			2011-12	2011-12
			Actual	Estimated
Fishstock		QMA	TACC	landings
RIB 1	Auckland (East)	1	121	29
RIB 2	Central (East)	2	176	27
RIB 3	South-east (Coast)	3	394	174
RIB 4	South-east (Chatham)	4	357	304
RIB 5	Southland	5	52	32
