## ORANGE ROUGHY WEST COAST SOUTH ISLAND (ORH 7B)

## 1. FISHERY SUMMARY

### 1.1 Commercial fisheries

From 1 October 2007 the TACC for this stock was reduced to 1 t. Previously the fishery was centred on an area near the Cook Canyon in statistical areas 033, 034 and 705. Up until 1996-97 approximately $80 \%$ of the catch was taken in winter (June-July) when fish form aggregations for spawning. From 1997-98 onwards about $50 \%$ of the catch was taken in winter. Reported domestic landings and TACCs are shown in Table 1, while the historical landings and TACC for ORH 7B are depicted in Figure 1.

Table 1: Reported landings (t) of orange roughy and TACCs (t) for ORH 7B from 1983-84 to present. QMS data from 1986-present.

| Fishing year | Reported landings | TACC |
| :--- | ---: | ---: |
| 1983-84* | 2 | - |
| $1984-85^{*}$ | 282 | - |
| $1985-86^{*}$ | 1763 | 1558 |
| $1986-87^{*}$ | 1446 | 1558 |
| $1987-88$ | 1413 | 1558 |
| $1988-89$ | 1750 | 1708 |
| $1989-90$ | 1711 | 1708 |
| $1990-91$ | 1683 | 1708 |
| $1991-92$ | 1604 | 1708 |
| $1992-93$ | 1139 | 1708 |
| $1993-94$ | 701 | 1708 |
| $1994-95$ | 290 | 1708 |
| $1995-96$ | 446 | 430 |
| $1996-97$ | 425 | 430 |
| $1997-98$ | 330 | 430 |
| $1998-99$ | 405 | 430 |
| $1999-00$ | 284 | 430 |
| $2000-01$ | 161 | 430 |
| $2001-02$ | 95 | 110 |
| $2002-03$ | 90 | 110 |
| $2003-04$ | 119 | 110 |
| $2004-05$ | 106 | 110 |
| $2005-06$ | 77 | 110 |
| $2006-07$ | 125 | 110 |
| $2007-08$ | 6.0 | 1 |
| $2008-09$ | 1.4 | 1 |
| $2009-10$ | $<0.1$ | 1 |
| $2010-11$ | 0.1 | 1 |
| $2011-12$ | 0.1 | 1 |
| $2012-13$ | 0.3 | 1 |
| $2013-14$ | 0.6 | 1 |
| $2014-15$ | 1.67 | 1 |
| *FSU data. |  |  |

Catches in the early-mid 1990s (especially 1994-95) were well below the TACC. The TACC was reduced to 430 t for the 1995-96 fishing year, then was reduced further to 110 t from 1 October 2001, followed by a further reduction to 1 t in the 2007-08 fishing year.

### 1.2 Recreational fisheries

There is no known recreational fishery for orange roughy in this area.

### 1.3 Customary non-commercial fisheries

There is no known customary non-commercial fishing for orange roughy in this area.

### 1.4 Illegal catch

There is no quantitative information available on illegal catch.

## ORANGE ROUGHY (ORH 7B)

### 1.5 Other sources of mortality

There is no quantitative information available on other sources of mortality in this fishery.

Figure 1: Reported commercial landings and TACC for ORH 7B (Auckland East). Note that this figure does not show data prior to entry into the QMS.

## 2. STOCKS AND AREAS

There is no new information which would alter the stock boundaries given in previous assessment documents.

Orange roughy in this fishery are thought to be a single stock. Genetic studies have shown that samples of Cook Canyon orange roughy are significantly different from Challenger Plateau and Puysegur Bank samples. Moreover, the size structure and parasite composition differ from fish on the Challenger Plateau. Spawning occurs at a similar time to fish on the Challenger Plateau and the Puysegur Bank.

## 3. STOCK ASSESSMENT

The previous assessment for this stock was carried out in 2004 and is summarised in the 2006 Plenary Report. Biomass was estimated to be $17 \% B_{0}(95 \%$ confidence interval $14-23 \%)$ when CPUE was assumed to be directly proportional to abundance.

An updated assessment was attempted in 2007 with the addition of catch data up to 2005-06 and new standardised CPUE indices. The Working Group rejected the assessment on the basis of the poor fit to the CPUE data. The effect was similar to the result from the 2004 assessment; namely a slow rebuild in recent years, which was not supported by the CPUE data.

### 3.1 Estimates of fishery parameters and abundance

Commercial catch and effort data are available from 1985 and were examined using both an unstandardised and a standardised analysis. Unstandardised catch rates have declined substantially over the course of the fishery but have shown no clear trend in recent years (Table 2).

The standardised CPUE analysis has been divided into two series to address reporting form changes: (i) using TCEPR data from 1985-86 through to 1996-97, and (ii) using CELR data from 1990-91 through to 2005-06. In addition, in order to increase vessel linkage across years, it was decided to use
all months of data not just that from the winter fishery (June-July) as has been done for previous standardisations.

Table 2: Summary of groomed data from TCEPR and CELR forms.

| Fishing year | Number <br> of vessel <br> days | Number <br> of tows | Total <br> estimated <br> catch $(\mathrm{t})$ | Mean daily <br> catch rate <br> $(\mathrm{t} /$ tow $)$ | Mean daily <br> catch rate <br> $(\mathrm{t} / \mathrm{h})$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| $1985-86$ | 138 | 357 | 1544 | 4.5 | 2.9 |
| $1986-87$ | 132 | 405 | 1250 | 4.0 | 2.7 |
| $1987-88$ | 132 | 420 | 1250 | 3.4 | 2.3 |
| $1988-89$ | 133 | 368 | 827 | 2.5 | 1.6 |
| $1989-90$ | 123 | 356 | 1282 | 4.5 | 5.6 |
| $1990-91$ | 208 | 632 | 1657 | 2.8 | 3.3 |
| $1991-92$ | 238 | 810 | 1601 | 2.0 | 1.4 |
| $1992-93$ | 258 | 784 | 1128 | 1.5 | 2.3 |
| $1993-94$ | 298 | 708 | 660 | 1.1 | 0.9 |
| $1994-95$ | 162 | 361 | 320 | 0.9 | 1.6 |
| $1995-96$ | 66 | 150 | 275 | 2.2 | 1.7 |
| $1996-97$ | 90 | 182 | 244 | 1.3 | 7.5 |
| $1997-98$ | 96 | 228 | 170 | 0.7 | 0.3 |
| $1998-99$ | 188 | 566 | 359 | 0.6 | 0.2 |
| $1999-00$ | 213 | 647 | 259 | 0.4 | 0.1 |
| $2000-01$ | 149 | 442 | 162 | 0.4 | 0.1 |
| $2001-02$ | 117 | 282 | 76 | 0.3 | 0.1 |
| $2002-03$ | 97 | 292 | 112 | 0.4 | 0.2 |
| $2003-04$ | 90 | 252 | 118 | 0.4 | 0.2 |
| $2004-05$ | 121 | 393 | 102 | 0.3 | 0.1 |
| $2005-06$ | 87 | 257 | 73 | 0.3 | 0.2 |

The standardised analysis for the TCEPR data used catch per tow in a linear regression model. Indices from this model (Table 3, Figure 2) show a steep decline after the first two years, followed by a more gradual decline and a slight increase in catch rates in 1995-96 and 1996-97.

Table 3: Standardised CPUE indices (relative year effect) based on TCEPR data with number of vessel tows from 1985-86 to 1996-97.

| CPUE | Number of <br> tows |  |  | Year | CPUE <br> index | CV | Number of <br> tows |
| :--- | ---: | ---: | ---: | :--- | ---: | ---: | ---: |
| Year | 1.99 | 0.20 | 153 | $1991-92$ | 0.48 | 0.23 | 231 |
| $1985-86$ | 2.13 | 0.23 | 150 | $1992-93$ | 0.29 | 0.23 | 230 |
| $1986-87$ | 1.11 | 0.26 | 212 | $1993-94$ | 0.14 | 0.25 | 341 |
| $1987-88$ | 0.58 | 0.22 | 310 | $1994-95$ | 0.13 | 0.27 | 172 |
| $1988-89$ | 0.61 | 0.22 | 236 | $1995-96$ | 0.51 | 0.33 | 37 |
| $1989-90$ | 0.76 | 0.23 | 238 | $1996-97$ | 0.41 | 0.26 | 104 |
| $1990-91$ |  |  |  |  |  |  |  |

The standardised analysis for the CELR data used daily catch in a linear regression model. Indices from this model (Table 4, Figure 2) show a steep decline for the first four years, followed by an increase to a peak in 1995-96, and subsequent low catch rates after then.

Table 4: Standardised CPUE indices (relative year effect) based on CELR data with number of days from 1990-91 to 2005-06.

| Year | CPUE | Number of |  | CPUE |  | Number of |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | index | CV | days | Year | index | CV | days |
| 1990-1991 | 2.17 | 0.27 | 110 | 1999-2000 | 0.34 | 0.27 | 131 |
| 1991-1992 | 1.11 | 0.27 | 108 | 2000-2001 | 0.34 | 0.28 | 88 |
| 1992-1993 | 0.74 | 0.27 | 126 | 2001-2002 | 0.33 | 0.28 | 73 |
| 1993-1994 | 0.28 | 0.28 | 81 | 2002-2003 | 0.61 | 0.26 | 67 |
| 1994-1995 | 0.53 | 0.30 | 46 | 2003-2004 | 0.59 | 0.25 | 75 |
| 1995-1996 | 1.16 | 0.33 | 29 | 2004-2005 | 0.35 | 0.24 | 114 |
| 1996-1997 | 0.53 | 0.38 | 19 | 2005-2006 | 0.36 | 0.26 | 80 |
| 1997-1998 | 0.36 | 0.30 | 52 |  |  |  |  |
| 1998-1999 | 0.39 | 0.28 | 112 |  |  |  |  |

## ORANGE ROUGHY (ORH 7B)

Figure 2: The CPUE indices based on: (i) TCEPR data (solid line and crosses) covering 1985-86 to 1996-97, and (ii) CELR data (triangles and dashed line) covering 1990-91 to 2005-06. The CELR index has been scaled so that it has the same mean value as the TCEPR index in the years that they overlap.

### 3.2 Biomass estimates

No estimates of current biomass are available. Based on previous stock assessments using CPUE data the TACC was cut back severely from about 1700 t in 1994-95 to 110 t in 2000-01. By the late 1990s the stock was believed to be well below $B_{M S Y}$ where it continued until at least $2004\left(17 \% B_{0}\right.$ in the 2004 assessment, Figure 3). Despite the large reduction in annual removals from the stock after 200102 , catch rates did not increase over the subsequent 5 years.

An updated assessment was attempted in 2007 with the addition of catch data up to 2005-06 and new standardised CPUE indices (Figure 2) based on TCEPR data (1986 to 1997) and a separate CELR series (1991 to 2006). These data were incorporated in a Bayesian stock assessment with deterministic recruitment to estimate stock size. The Working Group rejected the assessment on the basis of the poor fit to the recent CPUE data. The model was insensitive to the recent CPUE data and predicted a rebuild (driven by the recruitment assumptions) that is not supported by any observations in the fishery.

Figure 3: Biomass trajectory derived from Maximum Posterior Density (MPD) estimate of the model parameters (2004 stock assessment). The biomass trajectory is shown by the solid line; crosses denote the CPUE index scaled to biomass.

## 4. STATUS OF THE STOCK

## Stock Structure Assumptions

The ORH 7B stock has been treated as a single spawning stock located around the Cook Canyon area. It is assessed and managed separately from other stocks and is assumed to be non-mixing with orange roughy stocks outside of the Cook Canyon area.

| Stock Status |  |
| :--- | :--- |
| Year of Most Recent <br> Assessment | 2004 |
| Assessment Runs Presented | One base case |
| Reference Points | Target: $30 \% B_{0}$ <br> Soft Limit: $20 \% B_{0}$ <br> Hard Limit: $10 \% B_{0}$ <br> Overfishing threshold: - |
| Status in relation to Target | $\mathbf{B}_{2004}$ was estimated to be $17 \%$ Bo, Very Unlikely (<10\%) to be at or <br> above the target |
| Status in relation to Limits | $\mathbf{B}_{2004}$ was Likely (> 60\%) to be below the Soft Limit and Unlikely <br> $(<40 \%)$ to be below the Hard Limit |

## Historical Stock Status Trajectory and Current Status

Biomass trajectory derived from Maximum Posterior Density (2004 stock assessment model)

| Fishery and Stock Trends |  |
| :--- | :--- |
| Recent Trend in Biomass or Proxy | Unknown, but biomass is thought to be very low. |
| Recent Trend in Fishing Mortality <br> or Proxy | The fishery has been effectively closed since October 2007. |
| Other Abundance Indices | - |
| Trends in Other Relevant <br> Indicators or Variables | - |

| Projections and Prognosis (2004) |  |
| :--- | :--- |
| Stock Projections or Prognosis | Stable at current catch level |
| Probability of Current Catch or | Soft Limit: Already below the Soft Limit |
| TACC causing Biomass to remain |  |
| below or to decline below Limits | Hard Limit: Very Unlikely (<10\%) |

| Assessment Methodology and Evaluation |  |  |
| :--- | :--- | :--- |
| Assessment Type | Type 1-Quantitative stock assessment |  |
| Assessment Method | Age-structured model with Bayesian estimation of posteriors. |  |
| Assessment Dates | Latest assessment: 2004 $\quad$ Next assessment: Unknown |  |
| Overall assessment quality rank | - |  |
| Main data inputs (rank) | - Catch history <br> - CPUE indices (1985- <br> 2003) |  |
| Data not used (rank) | - |  |
| Changes to Model Structure and <br> Assumptions | - CPUE indices based on mean catch per hour as opposed to <br> previous measure of mean catch per tow |  |
| Major Sources of Uncertainty | - Recruitment assumed to be deterministic <br> - CPUE assumed to be directly proportional to stock biomass in <br> base model |  |

## Qualifying Comments (2010)

A further assessment was attempted in 2007 with updated information; however, this was rejected by the working group as the model was insensitive to the CPUE data. The model indicated that the stock had been rebuilding since the mid 1990s, a trend not supported by any observations in the fishery. The fishery was closed from 1 October 2007 and stock size is expected to increase.

## Fishery Interactions

Historically, the main bycatch species were oreos and deepwater dogfish. Bycatch species of concern included deepwater sharks, deepsea skates, seabirds and corals. The fishery is currently closed.
