

RIBALDO (RIB)*(Mora moro)***1. FISHERY SUMMARY****(a) Commercial fisheries**

In New Zealand ribaldo is caught on bottom longlines and as a bycatch to trawling. Up to 4920 t per year were reported by Japanese and Korean long-line vessels target fishing for ling on the Chatham Rise and east coast of the South Island in the 1970s. In recent years (since the early 1990s) most of the New Zealand catch has probably been by longline but most reported catch from about 1978 to 1990 has probably been as a bycatch during target trawling for hoki (*Macruronus novaezelandiae*), orange roughy (*Hoplostethus atlanticus*) and ling (*Genypterus blacodes*) (respectively) at 500–1000 m. Reported catch has been mainly from the Chatham Rise and east coast South Island (QMAs 3 & 4) and since 1991–92 from east coast North Island (QMAs 1 & 2). Reported catch prior to 1990 was probably less than actual catch because some of the ribaldo caught by trawling was discarded. Catches by Japanese and Korean longliners in the mid 1970s are shown in Table 1. Landings from 1982–83 onwards are shown in Table 2.

Ribaldo was introduced into the QMS from 1 October 1998. The TACCs have remained unchanged since 1998–99, with the exception of QMAs 1, 2 and 3, where quotas were raised for the 2000–01 fishing year. TACCs for the most recent fishing year (2003–04) are shown in Table 2, note during this most recent fishing year, the total TACC was exceeded by 22 tonnes.

Table 1: Japanese and Korean longline catch (t) of ribaldo (“deep-sea cod”) from New Zealand waters, probably mostly Chatham Rise and east coast South island, by calendar year from 1975–77.

Year	1975	1976	1977
Japan	2 417	4 920	4 283
Korea	–	–	286 ¹

1. Reported as “cods” but considered to be mainly ribaldo. The Korean fleet began fishing in April 1977.

Table 2: Reported landings (t) of ribaldo by QMA for fishing years 1983–84 to 2004–05 and TACCs (t) for the most recent fishing year 2004–05. The data in this table has been updated from that published in previous Plenary Reports by using the data through 1996–97 in table 32 on p. 262 of the “Review of Sustainability Measures and Other Management Controls for the 1998–99 Fishing Year – Final Advice Paper” dated 6 August 1998.

(b) Recreational fisheries

There are no known recreational fisheries for ribaldo.

(c) Maori customary fisheries

There is no known Maori customary fishing for ribaldo.

(d) Illegal catch

Estimates of illegal catch are not available.

(e) Other sources of mortality

There is no quantitative information on the level of other sources of mortality.

2. BIOLOGY

Ribaldo is known from the North Atlantic Ocean from Iceland to West Africa, the western Mediterranean Sea, the Indian Ocean south of Madagascar and the Pacific Ocean from Australia, New Zealand and Chile. In New Zealand it is widespread and has been caught by research trawl at depths of about 200–1300 m. It appears to be most common at 500–1000 m. The relatively high catch by bottom longline suggests that it favours rough bottom habitats.

Ribaldo reaches fork lengths (FL) of about 75 cm and 65 cm for females and males respectively. Most research trawls have caught fish ranging from 30 to 70 cm FL. There are few data on reproduction but trawl-caught samples suggest winter/spring spawning. Fish do not appear to form large spawning aggregations. Early life history is largely unknown but a few individuals less than 10 cm FL were captured in plankton nets in the upper 200 m of the water column over bottom depths of about 1000 m at the south west end of Chatham Rise.

No information on age, growth and natural mortality is available.

Table 3: Length-weight parameter values for ribaldo. $W = a.L^b$, where W is weight (g) and L is fork length (cm).

Symbol	Female	Male
a	0.0357	0.0531
b	3.29	3.30

3. STOCKS AND AREAS

It is not known whether different regional stocks of ribaldo occur in New Zealand waters but it is possible that there are separate stocks based on natural boundaries such as the New Zealand landmass, i.e., west and east coast stocks. The Working Group agreed on five fishstocks based on the four main fishing areas plus the Kermadec area, i.e., the east coast of the North Island (QMAs 1 and 2), Chatham Rise and east coast South Island (QMAs 3 and 4), Southland and Sub-Antarctic (QMAs 5 and 6), the west coast of New Zealand (QMAs 7, 8 and 9) and QMA 10.

4. STOCK ASSESSMENT

The first stock assessment for ribaldo was conducted in 1998. There are no new data since 1998 that would change that assessment.

(a) Estimates of fishery parameters and abundance

No estimates of fishery parameters have been made. No CPUE analyses were carried out because ribaldo is caught as a bycatch to other fisheries and because actual catch is probably less than reported catch. No analyses of research trawl survey abundance estimates were made because no trawl survey series has been designed to sample the depth range of ribaldo. Therefore, no estimates of abundance are available.

(b) Biomass estimates

Estimates of biomass are not available.

(c) Estimation of Maximum Constant Yield (MCY)

MCY cannot be estimated.

(d) Estimation of Current Annual Yield (CAY)

CAY cannot be estimated.

(e) Other yield estimates and stock assessment results

No information is available.

5. STATUS OF THE STOCKS

Actual catch of ribaldo has probably been greater than reported catch in the past but recent catch may be more accurate with increased reporting because of the species being included in the Quota Management System. It is not known if recent catches are sustainable in the long term or whether catches at the level of the current TACCs will allow the stocks to move towards a size that will support the maximum sustainable yield.

Summary of TACCs (t) and reported landings (t) of ribaldo for the most recent fishing year.

Fishstock	QMA	2004-05	2004-05
		Actual TACC	Estimated landings
RIB 1	Auckland (East)	1	121
RIB 2	Central (East)	2	28
RIB 3	South-east (Coast)	3	176
RIB 4	South-east (Chatham)	4	394
RIB 5	Southland	5	357
RIB 6	Sub-antarctic	6	52
RIB 7	Challenger	7	124
RIB 8	Central (West)	8	55
RIB 9	Auckland (West)	9	1
RIB 10	Kermadec	10	<1
Total			2
		1 282	1 149
